Doi Lower Ureteric Stones Expulsion  
Background: Ureteric (renal) colic is a common, painful condition encountered in the Emergency Department (ED). Sustained contraction of smooth muscle in the ureter as a kidney stone passes the length of the ureter leads to pain. The majority of stones will pass spontaneously (i.e. without urologic

Most of the earlier trials examining  $\alpha$ -blocker therapy for ureteric stones conclude that there is a higher stone clearance and faster stone expulsion time. From 2013 to 2015, multiple meta-analyses were performed for different  $\alpha$ -blockers (tamsulosin 87 , silodosin 88 , and alfuzosin 89 ) and those results were similar to those of the

efficacy of alfuzosin with methylprednisolone on expulsion and pain control of lower ureteral stones <10 mm in size. Between June 2005 and June 2007, 113 patients with lower ureteral stones <10 mm in size were enrolled in the study. The patients were divided into a control group (group I) and medical expulsive therapy group (group II).
